In three address code, at most three addresses are used to represent any statement.

General form:

The general form of three address code is-

$$a = b \text{ op } c$$

where-

- a, b, c are the operands that can be names, constants or compiler generated temporaries
- op represents the operator

Example :

i) $a = b + c$

ii) $c = a * b$

Common Three Address Instruction Forms ²

(I) Assignment statements :-

- $x = y \text{ op } z$
- $x = \text{op } y$

(II) Copy statement :-

(III) Conditional jump :-

$\text{if } x \text{ rel op } y \text{ goto } L$

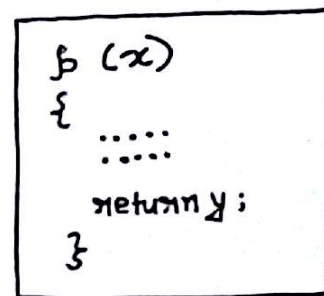

(IV) Unconditional jump :-

$\text{goto } L$

www.gatevidyalay.com

(V) Procedure call :-

param x call p
return y

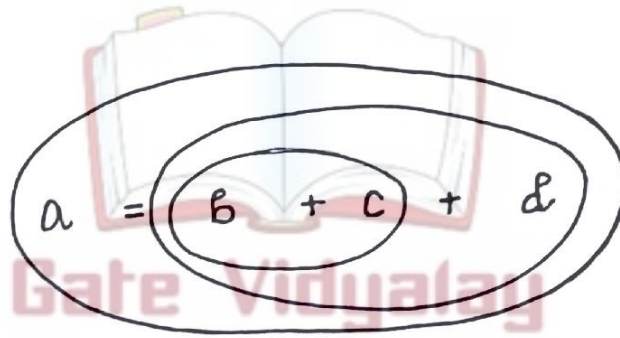

_____ address _____

Generation of 3 address code 2

Illustration-1: 2 Generate 3 address code for -

$$a = b + c + d$$

Soln.: 2

Three address code will be -

www.gatevidyalay.com

$$T_1 = b + c$$

$$T_2 = T_1 + d$$

$$a = T_2$$

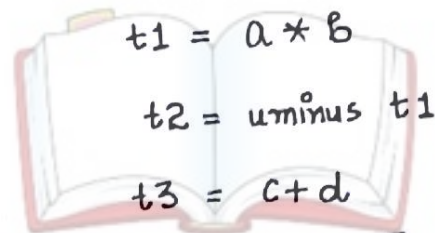

- '+' operator has higher precedence over '=' operator
- '+' operator is left associative.

Illustration-2: Generate 3 address code for -

$$-(a * b) + (c + d) - (a + b + c + d)$$

Soln:

Three address code will be -

$$\begin{aligned}t_1 &= a * b \\t_2 &= \text{uminus } t_1 \\t_3 &= c + d\end{aligned}$$

$$t_4 = t_1 + t_3$$

$$t_5 = a + b$$

$$t_6 = t_3 + t_5$$

$$t_7 = t_4 - t_6$$

→ Many operators have higher precedence over binary operators.

$$- [T_1] + [T_2] - [T_3]$$

$$[T_4] + [T_2] - [T_3]$$

$$[T_5] - [T_3]$$

$$[T_6]$$

Illustration-3: Generate 3 address code for -

if $A < B$
then 1
else 0

Soln:
2

(1) if $(A < B)$ goto (4)

(2) $T1 = 0$

(3) goto (5)

(4) $T1 = 1$

(5)

Illustration - 4: Generate 3 address code for -
z

" If $a < b$ and $c < d$ then $t = 1$ else $t = 0$ "

Soln:
z

(1) If $(a < b)$ goto (3)

(2) goto (4)

(3) If $(c < d)$ goto (6)

(4) $t = 0$

(5) goto (7)

(6) $t = 1$

(7)
